

Hair Filler

HAIR CELL AND SCALP REVITALIZATION

How it works:

Multiple Scientific and Clinical studies show that The injectable Hair Filler:

- Promotes increased blood circulation to the scalp and hair follicles
- Revitalises hair follicles and helps with Hair stem cell proliferation
- Induces hair growth by increasing the size of the hair follicle
- Prevents hair loss
- Maintains hair growth

Use of the Hair filler does not rely on the scalp's skin needing to absorb the product to be effective. By injecting this innovative Sustained release complex of Peptides into the dermis of the scalp, where the hair follicles lie, places the necessary active ingredients directly into the area of concern, thus increasing efficacy.

What can I expect during my Hair Filler treatment?

The area of concern will be assessed by your Doctor and solution and treatment programmed discussed with you, as this will depend on severity, size of area and cause of the hair loss.

If Necessary, Topical Anaesthetic will be applied to the area of concern, although the procedure is not painful, some minor discomfort may be felt only due to the needle penetrating the dermis.

The Hair Filler product will then be injected using a serial technique approx 1cm apart into the dermis of the scalp.

Initially, One treatment session every 2 weeks for 2 months is suggested (ie a total of 4 sessions).

Thereafter depending on your Doctors suggestion repeat sessions can be administered as well as maintaining the result for the long term.

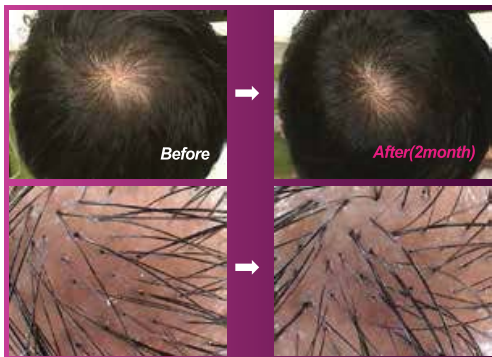

“Sustained Release & Peptide Technology”

Indications - who would benefit?

- Men and women suffering from Alopecia (Hair Loss) from multiple causes
- Men & Women who have a general thinning hair and want to prevent further loss
- Patients with damaged hair from braiding, hair treatments, hair dyes etc
- Hair transplant recipients who want to increase survival rate and maintain success
- For those wanting to encourage stronger healthier hair - to prevent hair thinning with age

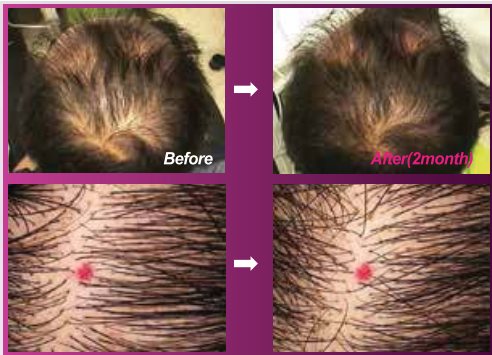

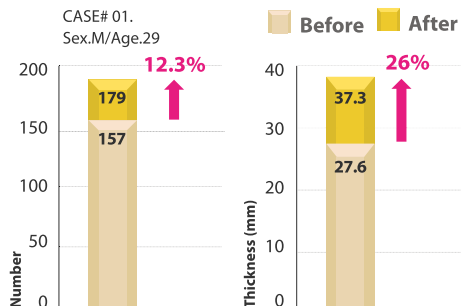

RESULTS.
